

Employee Attrition Prediction – HR Summary

Summary

The purpose of this project was to identify the factors that influence employee attrition and provide insights that can help improve employee retention, by analyzing employee information such as salary, job role, work-life balance, experience, and department, patterns were identified that indicate which employees are more likely to leave the company.

The analysis showed that the **Sales department** had the highest employee attrition rate, with **20.63%** of employees leaving the company. Among different job roles, **Sales Representatives** experienced the highest attrition rate at **39.76%**, making them the group that requires the most attention.

Salary also played an important role. Employees who left the company earned an average monthly income of approximately **rs4,787**, while employees who stayed earned about **rs6,833** on average. This suggests that lower-paid employees are more likely to leave. In addition, employees with poor work-life balance and those in their first two years of employment showed higher attrition rates, indicating that early employee experience is critical.

Based on these findings, the company should focus on improving employee retention in the Sales department, especially among Sales Representatives and newly hired employees. Reviewing compensation for lower-paid employees, promoting a healthier work-life balance, and strengthening onboarding and mentoring programs during the first two years can help reduce employee turnover.
